# What is inheritance?

The more general class is called the **superclass**

The more specialized class that inherits from the super class is called the **subclass**

# Without inheritance: A window

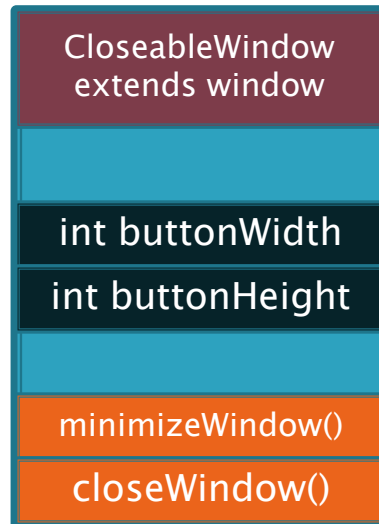

Window
int width
int height
drawWindow()

CloseableWindow
int width
int height
int buttonWidth
int buttonHeight
drawWindow()
minimizeWindow()
closeWindow()

FullWindow
int width
int height
int buttonWidth
int buttonHeight
String title
int iconWidth
int iconHeight
String iconSrc
drawWindow()
minimizeWindow()
closeWindow()
drawIcon()
displayTitle()

# A real example of inheritance: A window

# How to create inheritance?

```
class Cycle
```

```
{  
    int weight;  
}
```

Superclass

```
class BiCycle extends Cycle
```

```
{  
    String name;  
    String brand;  
}
```

Subclass

Only specify new variables and methods that are not a part of the superclass.

Cycle

Properties  
weight:

Bicycle

Properties  
weight:  
name:  
brand:

# How to create inheritance?

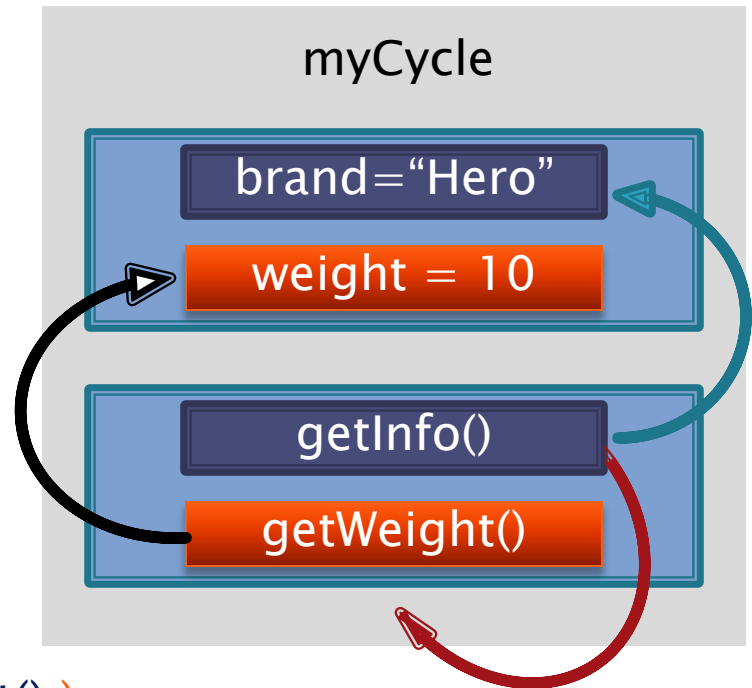

```
class Cycle
```

```
{  
    int weight = 10;  
    public getWeight()  
    {  
        return weight;  
    }  
}
```

```
class BiCycle extends Cycle
```

```
{  
    String brand = "Hero";  
    public void getInfo()  
    {  
        System.out.println(brand+" "+ getWight() );  
    }  
}
```

```
BiCycle myCycle = new BiCycle();  
myCycle.getInfo();
```

**Subclass can not access private variables and methods of a superclass.**
